

Stress Test

The CRO Card Game

A competitive enterprise risk management game for 2–5 players

You are the Chief Risk Officer of an insurance company. So is everyone else at this table. Your job is to build a company that can survive the worst the world can throw at it; everyone else's job is to find out whether it can. Every Scenario card is a stress test you run against your rivals' books: a Category 5 landfall, a nuclear verdict, a sudden rate shock. The last company still solvent wins. The first to fail learns the oldest lesson in risk management: the scenario you didn't plan for is the one someone else will run.

What you need

- One starter deck per player: a CEO card plus 40 cards (print from `print_sheets/`).
- Something to track Surplus (a notepad, dice, or poker chips).
- A first-player marker. Nothing goes on the cards: tapping is the only state a card shows.

How you win

You win if every other company goes insolvent. If the game reaches the end of round 10, the solvent company with the most Surplus wins (ties share the win).

Premium and Surplus

The game runs on two numbers, the same two an insurer watches.

- **Premium** is your income for the turn. Each untapped Product line makes 1 Premium; tap it to spend it. Your lines untap at the start of your turn, and Premium you don't use is simply gone. Premium pays for investments, programs, and scenarios.
- **Surplus** is your capital: the cushion that absorbs losses. Scenarios cost you Surplus. Hiring talent costs Surplus. If your Surplus is 0 or less after a scenario resolves, your company is insolvent.

Premium is the income statement; Surplus is the balance sheet.

The cards

Product lines

(like lands) You may write one Product line per turn. Each line taps for 1 Premium, but it also carries **exposures** (risks scenarios can hit) and sometimes **hedges** (risks it offsets). When you write a line you gain its **Margin**: 1 Surplus per exposure it carries. Riskier lines pay more up front, and every line you write is something a rival can hit.

Investments

(*like artifacts*) Pay the Premium cost. At the start of each of your turns, an investment pays its **Yield** in Surplus. A few pay in cards instead: they have no Yield and draw you a card at the start of your turn. Most investments have a **Sale** value: at any time you may liquidate one for that much Premium or that much Surplus. **Illiquid** investments can't be sold. Investments carry exposures too, and some are destroyed outright by specific scenarios.

Programs

Your risk management. Three kinds:

- **Treaties** (*like enchantments*) cost Premium to put in play, then stay in play. Most have an **Upkeep**: at the start of your turn, pay it in Surplus or discard the treaty. That is the reinsurance premium, and it comes out of capital. You can't pay Upkeep with your last Surplus. Some Upkeeps grow with your book. The Quota Share Treaty's grows with your Product lines. A treaty that makes one kind of exposure not count (the swaps and the credit line) costs 1 Surplus a turn for every exposure of that kind you carry, even hedged ones.
- **Covers** (*like auras*) attach to one of your Product lines or investments and stop its exposures from counting.
- **Responses** (*like instants*) are played while a scenario is being run. Premium you leave untapped is what pays for them.

Talent

(*like creatures that never attack*) Exceptional employees. Hire them by paying their Hire cost in *Surplus*. Many require a Product line of a particular type. You control at most one copy of each employee.

CEO

Your company's leader, a Talent card that starts on your board. Your CEO can't be poached or fired and isn't one of your 40 cards.

Scenarios

Stress tests you run against rivals. Pay the Premium cost on your turn. Each one says who it hits.

Setup

1. Each player takes a deck, puts its CEO face up on the table, and shuffles the other 40 cards.
2. Everyone starts with this much Surplus:

Players	2	3	4	5
Starting Surplus	16	18	25	28

In a two-player game every scenario loss is doubled, because each scenario has only one company to hit.

3. Draw 7 cards. You may mulligan once: shuffle your hand back and draw 7 new cards.
4. Anyone holding a **Forecast** scenario in their opening hand shows it to the table.
5. Choose a first player and give them the first-player marker.

A round

Starting with the first player, each company takes one turn. At the end of the round the first-player marker passes to the left, so no seat always goes first or last.

Your turn

1. **Untap** your Product lines and talent.
2. **Upkeep.** In this order:
 - a. Pay any interest you owe from a Surplus Note or credit line.
 - b. Collect your investments' Yield, and draw any cards your investments and employees give you.
 - c. Pay treaty Upkeep in Surplus, or discard the treaties you stop paying for.
 - d. Resolve the next chapter of any Saga you ran. Keep a running Saga face up in front of you and turn it a quarter turn after each chapter, so its position shows which chapter is next; discard it after the last.
3. **Draw** one card. If it is a **Forecast** scenario, show it to the table before putting it in your hand. You can't run it this turn. If your deck is empty, you just stop drawing.
4. **Main phase.** In any order, as often as you can pay for it:
 - Write **one** Product line and gain its Margin.
 - Make **one talent move**: hire an employee from your hand, or **poach** one from a rival.
 - Play investments, treaties, and covers.
 - Run scenarios.
 - Use your talent's and treaties' abilities, and liquidate investments.
5. **End.** Discard down to 7 cards. Then each other player, in turn order, may run one **Flash** scenario.

Running a scenario

1. **Pay** the Premium cost. For a target-opponent scenario, choose the target.
2. **Dilemma.** If the scenario is a Dilemma, each company it hits secretly chooses Hold or Sell (a coin under your hand works: heads to sell), then everyone reveals at once. The card says what each company loses for each mix of choices.
3. **Response window.** Starting with the player to your left and ending with you, each player may do any of the following, then pass:
 - play Response cards;
 - tap talent to use their abilities;
 - liquidate investments or draw on a credit line to raise Premium.

There are no responses to responses. When someone **counters** a scenario, the player who ran it may pay the listed Premium to keep it going; otherwise it is cancelled. Only a company the scenario hits can counter it, and an **Act of God** can't be countered at all.

4. **Resolve.** Every company the scenario hits works out its loss (below) and pays it from Surplus. Then apply the card's other effects, destroy any investments the scenario wipes out, and pay natural-hedge gains.
5. **Check for insolvency.**

Drawing and discarding

Some cards draw you extra cards: a line when you write it, a Response when you play it, or an investment or employee at the start of your turn. Some scenarios make the companies they hit discard. Whenever a card makes you discard, you choose which cards go from your hand, and they go face up on your discard pile. If your deck runs out, you just stop drawing.

Who a scenario hits

- **Each opponent:** every company except yours.
- **Target opponent:** the one company you choose.
- **Systemic:** every company, *including yours*.

Working out a loss

For each clause on the scenario (for example “4 per Nat Cat: Flood exposure”):

1. Count your matching **exposures** across your Product lines and investments, and subtract your matching **hedgies**. Never go below zero. An exposure marked **x2** counts twice. **Nat Cat: Any** matches every Nat Cat peril, and a flood, quake, or wildfire clause hits it.
2. Multiply by the clause amount. Add any flat amounts and “per investment” or “per Program” amounts.

Then apply protection in this order:

1. **Covers and ignored exposures** (for example an interest rate swap) have already removed exposures in step 1.
2. **Halving treaties and talent.** Halve the matching clauses, rounding down.
3. **Flat reductions**, such as “each Mortality clause costs you 1 less.”
4. **Swap payments.** Add them if the scenario has the clause your swap pays on.
5. **Responses and tapped talent** prevent what they say.
6. **Excess-of-loss caps.** An excess-of-loss treaty caps what is left at its retention, every time.
7. **Recoveries.** A cat bond sponsorship or adverse development cover gives back part of the loss.

Talent, poaching, and your CEO

- You get one talent move per turn: hire, or poach.
- **Poach:** take a rival's employee by paying its Hire cost plus 2 Surplus. You must meet its line requirement, and you can't already control a copy. The poached employee signs a new contract and gains **Non-compete**, so it can't be poached back.
- Some scenarios make companies fire employees. Your CEO is never fired or poached.

- An employee you tap on your own turn (for example, to pay Surplus for a card) stays tapped until your next turn, so it can't step in during anyone else's scenario.
- You can't pay Surplus that would drop you to 0 or below.

Insolvency

When a company's Surplus is 0 or less after anything resolves:

1. It automatically sells its liquid investments, highest Sale value first, until its Surplus is above 0.
2. If it still has 0 or less, it is **insolvent** and out of the game.

Companies that fail at the same moment leave together. Some cards, like Too Big to Fail, make a failure cost every other company Surplus; if that drops another company to 0 or less, it fails the same way.

Keywords

Act of God

This scenario can't be countered.

CEO

Your CEO is a Talent card that starts on your board. It can't be poached or fired and isn't part of your 40-card deck. Starter decks name a CEO; in constructed play, any Talent card can be your CEO.

Cover

Attach to one of your cards when you play it. If that card leaves play, discard the cover.

Dilemma

Before the response window, each company the scenario hits secretly chooses Hold or Sell, then everyone reveals at once. What each company loses depends on what everyone chose.

Flash

You may also run this at the end of another player's turn.

Forecast

When you draw this card or search your deck for it, show it to the table, then put it in your hand. You can't run it that turn.

Hire

Pay this much Surplus to hire the employee. You get one talent move (hire or poach) per turn.

Illiquid

This investment can't be liquidated.

Margin

When you write this Product line, gain 1 Surplus per exposure it carries. Riskier lines pay more up front.

Non-compete

This employee can't be poached.

Poach

On your turn, take an opponent's employee by paying its Hire cost plus 2 Surplus. The poached employee gains Non-compete.

Response

Play only while a scenario is being run, before it resolves.

Saga

Chapter I resolves when you run it. At the start of each of your turns, the next chapter resolves. Discard it after the last chapter.

Sale

Any time, you may liquidate this investment for its Sale value, taken as Premium or as Surplus.

Systemic

This scenario hits every company, including the one that ran it.

Upkeep

At the start of your turn, pay this much Surplus or discard the treaty. You can't pay it with your last Surplus.

Yield

At the start of your turn, gain this much Surplus from the investment.

Starter decks

Deck	Line	CEO	Style
Mortality Mutual	Life	Eleanor Marsh, Founder	Mutual Patient. Builds a wide book and leans on mortality protection.
Retirement Guarantees	Annuity	Walter Ng, Spread Maximizer	Back-loaded. Hedges markets and longevity, strongest late.
Medical Trend	Health	Dr. Priya Anand, Network Builder	Fast. Wide book early; needs trend and regulatory protection.
Catastrophe Underwriters	P&C	Rusty Calloway, Cat Veteran	Swingy. Rich margins and strong cat protection; one missed hedge hurts.
Surplus Lines Syndicate	Specialty	Vivian Stroud, Syndicate Chair	Aggressive. Cheap targeted scenarios; litigation and liquidity exposure.
Moral Hazard Holdings	Annuity	Theo Blackwood, Dealmaker	Predatory. Two talent moves a turn, scenarios that strip your staff, and Too Big to Fail as a hostage.

Each starter deck has 15 Product lines, 4 investments, 5 programs, 4 employees, and 12 scenarios, plus its CEO. In simulated games every deck wins close to its fair share at every table size, and the first-player rotation keeps seat advantage within a few points.

Moral Hazard Holdings is the villain: a private equity roll-up that poaches your people, bets against you, and holds Too Big to Fail over the table.

Building your own company (charter format)

- Exactly 40 cards. Any number of Product lines; at most 3 copies of any other card. Most decks want 14–17 lines.
- Choose **any Talent card** as your CEO. It starts on the board and isn't one of your 40 cards (so it can't also be in your deck).
- Pack scenarios for the companies you expect to face, not the ones your own book avoids. Scenarios never hit you unless they are Systemic.

Playing like a CRO

- **Your opponents are your reverse stress test.** Look at a rival's board and ask which scenario breaks it. Then look at your own.
- **Tapped out means uninsured.** Premium you leave untapped pays for Responses. Premium you spend on growth can't protect you on someone else's turn.
- **A revealed threat already costs money.** When a rival shows a Forecast hurricane, everyone exposed starts paying: treaty Upkeep, Premium held back, cover. That is a risk load.
- **Concentration kills.** Ten Mortality exposures turn one pandemic into an insolvency. Diversify your lines, or buy the treaty.
- **Liquidity is not solvency.** Selling investments or drawing a credit line buys time, not capital.
- **Natural hedges pay twice.** A line's hedges offset other exposures, and some investments gain when disasters hit.
- **Key people are a risk.** Your best hire is everyone else's best poach.
- **Cards are options; Surplus is capital.** A card drawn today may save you tomorrow, but paying Surplus for cards thins the cushion that keeps you solvent.

A note on the scenarios

Cards based on real disasters are written as *as-if replays*: what would the same event cost today's books? That is how catastrophe modelers use history. Those cards keep a sober tone; the humor is aimed at markets, regulators, and corporate life.
